What !version of IDL do you have?
IDL> print,!VERSION

The WINDOW() function was introduced as part of the new IDL graphics introduced in Version
7.0.   You won't be able to run this code if you have an earlier IDL version or (I believe) if you are
using GDL.

If you do have IDL 7.x or IDL 8.x then your !path is not set up correctly.   Somewhere in your
!PATH you should have a ...lib/graphics directory.

Actually, the new IDL graphics was introduced in IDL 8.0.   Since you have IDL 7.06 you won't be
able to run the code (or you will have to update it to use traditional IDL graphics.
