What you want to use are the RESOLVE_ROUTINE and RESOLVE_ALL procedures, which allow you to compile routines from within a procedure or function. See the online documentation for more information.

This does not necessarily reflect the views of Texaco Inc.

You can use a batch file, for example:

```
;mycompile.bat
```

```
;
```

```
;Compile all of the routines used in my application and save them to
```

```
;a .XDR file.
```

```
COMPILE myprint mydisplay mycalc mygui
```

```
SAVE, /ROUTINES, FILENAME='myprog.xdr'
```

```
EXIT
```

Then you can execute this file by:

```
IDL mycompile.bat
```

or

```
IDL> @mycompile.bat
```

To execute the program that has been compiled you can make another batch file:

```
;myprog.bat
;
;Load and execute my program

RESTORE, 'myprog.xdr'      ;Restore the compiled routines
mygui                      ;Execute the procedure that starts
                           ;everything up
EXIT                       ;Exit IDL when everything is done
```

This can be executed in the same manner as above.

I hope this helps.

A batch file will do the job you want. Just create a file with the list of names each preceded by ".r" and the use @<filename>
