Hello,

I was wondering if there is any interest in a
Fortran-callable PostScript plotting library. I have
developed one over the past several years and have
used it extensively to create publication-quality
graphics. It's written in Fortran 77 and should
be platform-independent. It supports 35 PostScript
fonts and color, and is free for the asking.

Warning: It's not a pushbutton-type library, that is,
you can't create a graph with a single call. However,
it gives you almost total control over your plots,
which is why I developed it in the first place. Also,
it's 2-dimensional only.

If you're interested, email me and I'll let you know
how to access the library.

-Kevin
