Does anyone have a routine in pv-wave that allwos you to save images in GIF format? currently we are saving using the write_srf then converting from raster to gif but there is a problem with the write_srf function running on DEC workstations. pv-wave has said they will not rewrite the write_srf function since its 'un supported' so i was wondering if anyone either had the write_srf function re-written for DEC's or if anyone had a write_gif function in pwave so images could be written directly in GIF format? Thanks for the help!
