Hi

   I've just come to IDL from C++ and Delphi and I'm finding it weird.
I've been using the Widget Builder, and it has some dialog boxes for
loading files. I thought it would be time-efficient to incorporate one
of these boxes into my application, but when I tried I found the code
spread over several subroutines and they didn't seem to like being
transplanted. I used a whole day failing to implement a dialog box.

   I can't be the only soul in this position. Can anyone direct me to a
stock of reusable IDL components, or to some document that could guide
me in my endeavours,

   TIA,
