I have been fiddling around with the CGM device in IDL v4.0.1b and there are a few things that seem odd to me... for one thing, it seems odd that I cannot find a way to change the resolution of the device... it by gum wants to be 32768x32768. Is this the nature of CGM, or is it a feature of IDL's implementation? Perhaps I am merely clueless.... I'd like to make a plot that isn't 19 inches square on occasion :)

Gee, this makes me feel like a newbie again :) Are there any helpful souls out there with some IDL CGM (or maybe I just need CGM) experience that can tell me how to use IDL to make a CGM file of arbitrary size?
