Subject: regridding questions...

I have some data that is sampled on a close-to-rectangular grid that
looks something like the following:

```
  _____
 /
 /
 \
  _____
        \
         \
          /
   _____/
  /
 /
```

Are you following me? I have the x and y points defined in an MxN
array. The data is an MxN complex array. How would I go about using,
or can I even, some IDL function to accomplish getting the data points
on a regular rectangular grid?

I have tried to use triangulate and trigrid with no success. krig2d
can't allocate enough space for the new array.

I've come to a dead end and any help would be greatly appreciated!

TIA,
