We use IDL for the analysis of brain structure using MR imaging, which is similar, so yes, I think IDL would be very well suited for your purposes. It is used extensively in medical imaging, for MR, SPECT, PET, etc..

I can't help but wonder if you would get good results from having a MR (magnetic resonance) scan of the injury, as a series of images thru the region at resolution down to 1mm, and then treat the series of images as a volume. Just a thought.
