Subject: Extracting vertices from an ROI (region of interest)
Posted by santha on Mon, 17 Jun 1996 07:00:00 GMT

Hello,
 I am using IDLs cw_defroi() routine to draw regions of interest
in images. I would like to get the vertices covering the region I have drawn.
In the NON-Widget version (ie. defroi()) there is an optional argument
to get the vertices. But there is nothing like that in cw_defroi(). I greatly
appreciate any help. Thanks in advance.
