- > doesn't exhibit the problem.

Three kind people responded, but can't reproduce the problem. I have done a little more investigation and can more accurately describe the symptom: whenever I give focus to the graphics window, the \_window gets erased\_. This happens both with a private colormap and shared colormap.

Is this an IDL problem, a White Pine problem or operator error?

To repeat:

My configuration:

clients: IDL 4.0.1b (SunOS and OpenVMS, same behavior) server: White Pine eXodus 6.0, running on a Power Mac 7200

settings: Backing store support: Use When Mapped

Colors: 256

Color Matching Tolerance: (Normal, Exact, Tolerant -- all NG)

display: Monitor Control Panel set to 256 colors

Output of help /device:

Current graphics device: X

Server: X11.0, eXodusPowerPC 6.0 Display Depth, Size: 8 bits (1024, 748)

Visual Class: PseudoColor (3)

Bits Per RGB: 8

Physical Color Map Entries (Used / Total): 64/256

Colormap: Shared, 64 colors. Translation table: Enabled Graphics pixels: Combined. Dither method: Ordered

Write Mask: 255

Graphics Function: 3 (copy)

Default Backing Store: Reg from Server

Window Status:

## 0: Win(640, 512, Req from Server)

Thanks for any help.
