Anyone else experiencing this? We have a licensed IDL running on IBM AIX, but when you try and start IDLtool from the IBM to display on our suns, it inevitably crashes OpenWindows. (sunos 4.1.3)

Starting IDL itself, not IDLtool, doesn't produce any problems.

Can't seem to find any reference to such bugs in the release notes.

IDL version is 4.0.1

thanks

I experienced such crashes, too. They tend to happen when I use BOTH Netscape and IDL, using the widgets. Don't use the IDLtool. I have a theory about the combination of two Motif applications, but didn't verify it yet, because this only happens with SunOS 4.1.3, and not with Solaris 2.x.

Alex
