Subject: which stream is prompt written to?

I need to pipe commands into idl and recieve the output from the stdout and stdin streams. It all works fine except that I don't receive the "IDL> " prompt. I'd like this so that I can know when a command has finished.

Does anyone know how RSI puts this on the screen?

Also (a related question), If I move my code to windoze, is there a streams interpreter or only the win GUI?

Carl
