Netters,

I am currently working on a research project that involves generating solid or geometric models from MRI images. Part of the procedure will require me to possibly perform Thresholding & Edge Detection on my MRI images in order to find out which pixels lie on boundaries between two different regions.

Thus, I would like to have an Image Processing Software package that has good Edge Detection and Classification (Segmentation) modules/routines.

I have heard a lot about Khoros (University Of New Mexico) and PV-WAVE (Precision Visuals) and was curious if other professionals or students had any experience on how good they are for the above purposes. Suggestions on other software packages are also much welcome.

Thanks,

Ahmed Nadeem
