Hi,

I'm having this strange problem using XLOADCT on our Windows 95 machine. If I load up XLOADCT, the color table gets refreshed neither on the color band on the top, nor on the image I want to change the color table for. This even happens in the demo! On our Windows NT 4.0 machine on the other hand, XLOADCT behaves perfectly normally, from the prompt or in the demo.

I don't know what the problem is, but it seems like many people might have run into it since my setup is not uncommon. Does anybody have any ideas? Thanks a lot!

Imad Jureidini

PS: We're running IDL 4.0.1 on both machines.
