Has anyone programmed a point&click widget oriented application for Raman/IR data in IDL?

I)am a new IDL user and want to programm a routine fpr treating spectroscopical data. My goal is a powerfull fitting procedure for the spectra, but I want avoid to create all the standard rotuines for visualization of spectr. data again. So my question is:

Has anyone programmed a standard widget IDL application for spectroscopical data, comparable to xvgr/xmgr (UNIX) or does anyone knows how I can get such an IDL routine?
