The IDLTOOL feature available with a unix platform does not work properly. Whenever I try to open, save or compile a file the IDLTOOL window crashes (The window disappears and the IDL application is no longer running). Does anyone else have this problem? I also use IDL on a PC and SUN workstation and do not have this problem. I seem to think it has something to do with the IRIX operating system version. If anyone has any ideas on this I would appreciate a reply. Thanks!
