Has anyone tried to include a ps image file generated from PV~WAVE 'TV'
into Latex file? I have a couple of 2-D, 3-D plot figures from PV~WAVE, when they
are included in Latex, after dvips, the figure can be put exactly in the
page center. But for images ps file, they are usually shifted to the left
instead of staying at the center. All of them are created as .eps file
format, and the commands that I used to generate ps image are:

```
-------
device,/encapsulated,filename=out_name
  device,bits_per_pixel=4
  tv,img
device,/close
---------
```

Could anyone give me some ideas why this is happening?
Any help would be much appreciated. (e-mail please)
