I'm looking for a way how to create sound on a webpage in the form of a loop. For example I have a WAV-file, which I loop and you get non-stop sound.
How can I achieve this?

You can send solutions to the following e-mail adress:
et@kan.be

Thanks for your help.

I bet you hated it when movies got sound.

Sorry, uw.clubs.waveform.tranmission _SHOULD NOT_ be included in this thread. This newsgroup is for discussions about a club at the University of Waterloo in CANADA which is totally unrelated to your

question.

Please remove this newsgroup from the list of groups. Thank you.

Although it is nice to see that we're readable all the way from Belgium.

I am guessing <backround src="sound.wav"> or something like that. Like Rob Frydryck stated, repeating sounds is an excellent way of keeping that web counter low. Even MIDI files are kinda annoying. I think the web should just stick to visual, not audio (I could name olfactory, taste, and touch, but that'd be one sick webpage anyway!) Regards,

Jonathan

Do you REALLY want to do this??? Most of the time continuous sounds are MIDI files not wav, and unless you have a REALLY INCREDIBLE track your effort simply becomes annoying to the person viewing your page. I suggest you don't play continuous sounds.

I did exactly the same thing (pu a .wav as a background music) but when ever someone went on to my pages they got a warning saying that a file was loading into their system which could not be scanned for virus ect or something like that, but use midi files as when ever I have gone onto a site with midi as background music nothing comes up and it just loads and plays no prbs
