Guru stuff are way out of my league, but I'll never learn anything if I don't stick my neck out sometimes. Right? :-)

Quote: "The result of an operation becomes the same type as the operand with the greatest precedence or potential precision."
IDL's User guide (Ver. 4) pp: 4-3

The precedence list of the 8 atomic data types stacks "string" as the type with least precedence. So I guess, since 0 is an integer 'number' is converted to an integer (two steps up on the list) and prints 11 'Cool...!'s.

"weird"? Mnjaaa...? but definitely hazardous

Runar
