Subject: color table number

When you load one of the pre-defined IDL color tables, using
loadct or xloadct, is there a system variable set that one
can reference later on to determine which color table you
have set. I'm writing a procedure that requires one of the
pre-defined color tables to be loaded, but since the procedure
will be called frequently, I don't want to load the color table
if it already is loaded. If you know what I mean.

   Friday afternoon and my brain is foggy,
   Frank
