Whoops,

They are actually sitting on my *shelf*. Well, they are really
on my computer, but I ... Oh, never mind!

ENVI is a fine product, no question about that, with a *lot* of great functionality. The way Adam Letkoff and the other programmers at Better Solutions Consulting have implemented memory management in ENVI is just flat-out outstanding.

But, given the requirements stated above, ENVI--with its larger price tag--may be just a *bit* of overkill. How many features will you be paying for that you won't use? Will the ENVI interface be confusing or helpful to your end users?

I have IDL programs sitting on my shelf here to do most of what you have in mind. Throw in Phil Williams' great modular tool XDISPLAY to handle region of interest problems for you, and I'll bet a fairly sophisticated program meeting most of your requirements can be put together in IDL in less than a week.

The main advantage of this, of course, is that you won't need the ENVI widget library at all. This will make your program more portable when all those NASA types get word of it. :-)

My two cents worth.

Cheers!
