Hmm, I am running the AcceleratedX X server and X11R6
holds the X installation. I have a Red Hat installation with
no other changes (I think!). I thought my setup was pretty standard ...
hence I blamed IDL. To repeat, no other apps seem to mind!

Thanks,
bijan

I don't know *where* the problem lies, but it's not IDL. Works here
with no problems (2.0.29, too, on a P5-133).

What version of X are you using?

Peter

We had the same problem as well, on a PPro 200 running Redhat 4.0. Previous installation from the same IDL CD on a P120 worked just fine. The problem is currently "solved" by using the IDL 5.0 pre-release, which works just fine. My best guess was a conflict with the Moo-tif we installed earlier, but perhaps not.
