Hello,

I've set up this colour table:

```
TVLCT,255-INDGEN(256),255-INDGEN(256),255-INDGEN(256)
```

and then I do

```
CONTOUR, A, /FILL
```

How can I exactly obtain on the Postscript device the same picture
it's displayed on the X device?

Writing

```
DEVICE,FILENAME='foobar.ps',/COLOR, BITS=8
```

creates some dark areas that are not present in the picture on the X
device. Can a kind IDL guru help me? Many thanks!

Best regards,
Roberto
