Can structure definitions in a C program be directly read into an IDL program? I am not a C programmer, so please forgive any ambiguities in my terminology. I am using IDL to check results from a C program. The results of the C program are written to a file in a form defined by a structure found in a .h file.

I have been able to manually re-write the definitions of these structures in IDL, but, as the structures occasionally get redefined, it is cumbersome to hand correct these changes. Is there a procedure or a function that will take the structure definitions written in C and translate it into an IDL structure?

Thanks for any insights.
