Hello!

Under IDL 5 there are some new nice thing. But very :((((, that not find all sources...
If you are calling LIVE_SURFACE e.g., you have a very nice printer button.

Has anyone an idea, how to realize this?
Having a "picture" in a window/part of a window, created by some commands, e.g., surface, axis and so on, and than only need to press the button and the picture is printed, without recalling all teh grafic commands for the printer device??

Any help is welcome...

Regards, Astrid
