Hey Wave-Users;

I have the following to problems:

- with image_read i create an associative array in image format. Is
  it possible to read from that array the horizontal and vertical size
  from that image, for example to create a frame?

- i have the following short sequence:

```
  PRO DrawCB, wid, data
  COMMON draw, img
  image_display, img
  END
```

  and in the main programm the following lines:

```
  COMMON draw, img
  ....
  img=image_read('picture.xxx') ; xxx can be tif, bmp, ...
  ....
  draw=wwdrawing(layout, 1,'DrawCB', [256,256], [512,512])
  ....
```

  how is it possible, that the image_read displays the picture in
  field, which was defined with wwdrawing?

Thanks for help

michael
