Can anyone please help me!

I am new to IDL and have only recently started to program in this language. I have designed a number of small codes to plot 3-D graphs for sets of data from experiments carried out in the laboratory where I work. I would like to 'standardise' the colour table so that for any of the given values in any of the different plots there is a colour associated with that particular value. My problems have been that the colour table maps on to the graph and not the graph on to the colour table. Does anyone understand my problem, and if so can they help me.

Many Thanks

Neil.
