Subject: Bugs in histogram-function?

Hi,

I'm using the histogram function in IDL 4.0.1 for IRIX. When I ask for the histogram of a relatively large array, 196886 elements, some points turn out to be 0, even though the values exists in the array. The preceding point gets the right value of the "0-point" + the value it shold have. Do anyone have experience with this kind of trouble? How do I avoid it?
