Hi Folks,

I had a friend ask a question about IDL that I didn't know how to answer. (Uh, math is not my strength, you understand. :-))

Suppose I have a set of raw data that is described theoretically by two parametric equations. And suppose I need to fit these two parametric equations to the data since there is no mathematical way to convert the $x(t)$ and $y(t)$ equations into a $y(x)$ form. Is there a curve fitting routine in IDL that can handle parametric equations? Or, failing that, has anyone handled something like this in IDL and would be willing to give us a little help?

Many thanks,

David
