Hello!

i'm new in IDL programming so my question may be very dumb/simple/funny/etc but i cant solve this problem by myself.

i have a formatted file like this:

=====

```
1877383765  1.778
1877384765  1.685
1877385765  1.599
1877386765  1.599
1877387765  1.685
```

=====

and i need to load it into two arrays. the first array is LONG-type,
the second one - FLOAT-type. How i can do this?
("READF, file, Time, Data" does not work).

%-\ HELP!
