
Subject: CALL EXTERNAL under Windows

I have a number of C routines which I want to use in IDL by using the CALL_EXTERNAL routine. The manual is not very helpful in this case because there is only a reference to Charles Petzold's book "Windows95 Programming"

and an example using a Microsoft compiler.

I don't want to read the whole book to create a DLL with my Borland C 5.0 compiler.

Can anybody give me a short description of the compiler settings I should use or an appropriate makefile?

Thanks in advance,
