If you are using IDL this should work.

Are you sure you placed test.bat in the correct directory?

You may

1) type the full path of test.bat

2) try just "spawn" and then type test on the spawned MS-DOS window.

Manuel

Do you use IDL or pv-wave?

If you use pv-wave, it depends on the environment you use. Spawn only works with Unix or OpenVMS but not with windows. Take a look in the on-line help interapplication communication of pv-wave.

Klaus
