Do you mean the User's Guide for Version 4? Which chapter are you referring to??

There are windows-specific routines for input and output to the hardware
ports on a PC.
Unfortunately, I have not had a chance to try them. The routines are
documented on page
18-32 of the "old" IDL User's Guide. I can't find it in the new docs
and there is certainly
no mention of it in the index. Let me know if you want more info.

Thanks for your info.

I have just documentation on version 5.0, March 97, and I would appreciate further information on those routines you mention.

Best,

Michael

What operating system are you using on your PC? If you are using DOS/Windows 3.1 then you can use the INP/INPW functions to read from the serial port and the OUTP /OUTPW procedures to write to the serial port. However, I suspect that you are probably using Windows NT. In that case, you are indeed correct that you must use a DLL and the CALL_EXTERNAL function. Under Windows NT, all hardware resources (which includes serial

ports) are protected by the operating system. This means that any process which would like to use a hardware resource must request access to the resource from the operating system--the old INP/OUTP routines accessed the I/O port directly (in fact using the HEX address of the port explicitly in the function call). Thus, under NT, accessing the port is multi-step process. First, you must request access to the port from the operating system. If the port is free, the operating system will give you access to the port. Then, you can read and write to the port. Finally, when finished, you must release the port so other processes may use the port if necessary.

I am by no means a windows programmer, but I have written a DLL which allows access to the serial ports. For each of the DLL functions, I have a corresponding IDL function/procedure to make access to the serial port essentially transparent in terms of usage of the CALL_EXTERNAL functions and the packaging of the arguments required by the various DLL functions. The DLL was written and compiled using a Borland C compiler. I would be more than happy to make the source code available to anyone who wants it.

Cheers,

Robert K. Pina
