When I pass a 2-dimensional double array to the library function
XVAREDIT.Pro and edit the table and accept the changes, I receive this
message:
% XMANAGER: Caught unexpected error from client application. Message
follows...
% Invalid pointer: PEVAL.
I am running Version 5.0 Win32 (x86). Does anyone have a solution to
this problem?

You can tell XMANAGER to stop when an error is encountered, as it was
the case in IDL 4. This is done with

 XMANAGER, CATCH=0

I think. You can see then in which line of the code the error happened.
Maybe this can give you a hint what's going wrong.
