```
FUNCTION READ_STACK, filename, ASSOCIATE=associate
IF N_Params() EQ 0 THEN filename = Dialog_Pickfile()
IF filename EQ " THEN RETURN, -1
OpenR, lun, filename, /Get_Lun
IF Keyword_Set(associate) THEN BEGIN
    image = ASSOC(lun, IntArr(128, 128))
ENDIF ELSE BEGIN
    image = IntArr(128,128,96)
    READU, lun, image
    FREE_LUN, lun
ENDELSE
RETURN, image
END
```

Now, if you want the whole stack in a variable, you type
this:

```
image = Read_Stack('myfile.dat')
```

If you want to display the 20th image, you type:

```
TV, image(*,*,19)
```

If you want to do something with a particular slice, you
probably do something like this:

```
thisImage = Reform(image(*,*,19))
TV, thisImage * factor
```

The REFORM function will get rid of the third single dimension
for you.

If you want to use the associated variable method, which
I STRONGLY recommend, and you want to display the 20th image
you do this:

TV, image(19)

The Associate variable method will only read and write the data when it is required. This will be a much more efficient way to work with this kind of data.

Cheers,

David

Hi Jacobus,

I think it's easier than that. Just use READ or ASSOC and access the data either as a collection of 96 images:

```
OPENR,1,Filename  
Image = BYTARR(128L,128L,96L)  
readu,1,Image  
close,1  
(...)  
process_image,Image[*,*,i]
```

then you will get Image as an array of 128x128x96 (i.e. 96 128x128 images). Either with random I/O:

```
OPENR,1,Filename  
Stack = ASSOC(1, BYTARR(128L,128L))  
(...)  
Image = Stack[i]  
process_image,Image
```

here Image is just a 128x128 image. You access different images through the assignment "Image = Stack[i]". Since it seems that you process your images sequentially and they are not too big, I would prefer 1st solution because all I/O is made once for all.

Hope this helps.
