
Subject: Running PV-WAVE on a Xserver

Hi

We have PV-WAVE for SunOS. I need to fire it up on a Mac. (Quadra 14" monitor). I use MacX as my X server package on the Mac. I then start an xterm session from my Mac. From within the xterm I fire up Point & Click (wavepoint). I am able to run it but the windows that pop up are too big for my 14" monitor. I am running rootless windows. Is there a way of getting the whole thing scale down appropriately when I am running PV-Wave on a smaller screen? I guess I need to start MacX in the rooted mode or get a window manager running from my Sun itself. Has anyone done this before? I'd like some tips/techniques.

Thanks
-Aravind
