The DEFROI() function does what you want. I have that function implemented as part of a image "roaming" program in IDL. It requires the ASTRONOMY library at present. If you have this and want to try it, drop me a note.

In any event, here is the bit of code that I'm using with DEFROI():

```
print,'Define new HII Region'  
win_set,FrameWIN  
reslt=DefROI(512,512,xverts,yverts,/noregion)  
xverts=xverts*1./zoom+xmin-0.5  
yverts=yverts*1./zoom+ymin-0.5  
if (n_elements(ROInum) eq 0) then ROInum=0  
  openw,funit,'ROI'+strn(ROInum,length=3,padchar='0')+'.dat',/ GET_LUN  
  printf,funit,'; Region of Interest (ROI) Dump File'  
  printf,funit,'; Polygon Information:  
  tmp=polyfillv(xverts+1.0,yverts+1.0,NAXIS1,NAXIS2)  
  printf,funit,'NVERTS = ',strn(n_elements(xverts))  
  printf,funit,'NPIXELS = ',strn(n_elements(tmp))  
  printf,funit,'COUNTS = ',strn(total(image(tmp)))  
  printf,funit,'; List of Vertices follows:'  
  for qi=0,n_elements(xverts)-1 do printf,funit,xverts(qi),yverts(qi)  
  close,funit & free_lun,funit & ROI num=ROI num+1  
  wait,1
```

where ZOOM is the zoom factor of the displayed image and XMIN and YMIN correspond to the lower left pixel of the overall image displayed in your window.

hope this helps...

cheers,
Eric
