Does anyone know how to sort an array in idl (ala excell) while preserving the order of the other columns. For example, if I have a 10 by 10 array with the second column being time, how do I sort the entire array by time and have the values in the other columns follow. Like you'd do a sort in a spreadsheet. Please reply to lematta@spawar.navy.mil. Many thanks in advance. I've tried to figure out the sort function but I don't think it works on arrays with more than one row or column.

Regards,

Robert
