

Subject: POLY_FIT backward-compatible solution: Use 4.0.

For anyone who, like me, supports IDL installations still using 4.0, there is no way to have a single source version of your IDL application which uses the new 5.0 POLY_FIT, since the 4.0 version has no /DOUBLE keyword.

Until the whole world uses IDL 5.0, the solution must be to use the 4.0 POLY_FIT and distribute it with your source code, so the 5.0 site will have it. There is no accuracy penalty, and I can't perceive any speed differences.

That is the only way to avoid having version-dependent code. (I don't find anything in the Index under "version" that would let me determine the IDL engine's version, anyway, even if I were interested in doing that kind of workaround...)
