<HTML>

<PRE>Hi,</PRE>

<PRE></PRE>

<PRE>Any ideas how I can recognize in my routines that's they are runned by an idl runtime version</PRE>

<PRE>e.g. idl -rt='test.sav'.</PRE>

<PRE>Because I have the following problem:</PRE>

<PRE>I have written a function which will find the correct datapath independent from the different platforms.</PRE>

<PRE>I am using for this the known !path variable. But during runtime this isn't defined.</PRE>

<PRE>What I like to do is a static switch during runtime a defined path and during normally idl the path given</PRE>

<PRE> by my function.</PRE>

<PRE>I know about storing the variables too but I like to have another way.</PRE>

<PRE></PRE>

<PRE>regards,</PRE>

<PRE>Reimar</PRE>

<PRE></PRE>
