hello,

We have developped an application to display images using IDL 5.0. This application display the image and the user can perform scrolling on that image. It works fine for SunOS (SunOS lagarto 5.5 Generic sun4u sparc SUNW,Ultra-1). However the final platform is an IBM- RS 6000 running AIX. For this platform, when using the scrollbars the image get in black while moving through the image. If the external window is resized (using the window manager) the image gets back to its normal appearance... until you use again the scrollbars

(We use the /RETAIN option)

Any idea?

thanks.

Luis M. Gonz lez
