Subject: error handling in v. 3.51
Posted by anton on Sat, 16 May 1998 07:00:00 GMT

Is it possible to intercept errors generated in built-in procedures like
NR_DFPMIN (e.g. "roundoff problem in lnsrch") which cause a program to
halt? I want to write a handler which activates when the routine stops with
the error, but the main program is just halted.

I still use version 3.51

Thanks,

Anton
