Same Mike Schienle, just from a different address this time.
Personally, I get annoyed when I see the occasional post berating David
for mentioning he has written IDL books and sells them. Would it be better
to sell a batch of them to RSI and let them sell through their own
distribution? There will either be a mark-up on RSI's side, or a mark-down
on David's side. Nothing against RSI, but cutting out the middleman saves
everyone some money.

Here's something that happened to me several years ago that is somewhat relevant. I had a very mild car accident and the door wouldn't close properly. I took it to the body shop and asked to have it repaired. I was told it would be \$50 to align the door, which I paid, then asked when I could pick it up. The repair guy walked out to the car, opened the door and damn near lifted the car up by it. To my amazement, the door shut perfectly afterwards. Now, I don't want to imply that David writes code the way this guy fixes cars :-) but there are some functions that we have already written to handle situations like this. We developed them on our own time to solve our own problems.

The shareware cooperative is what I was alluding to when I mentioned having an ulterior motive at the end of the previous post. Like David, I get a real kick out of helping people with their IDL problems. I work as a contract programmer and depend on repeat customers and word of mouth. When I'm negotiating contracts I usually try to separate general purpose tools from application specific portions of the applications. The result is a lot of reusable code for my own use as well as filtering it through the IDL and PV-WAVE community. If I just give it away, the incentive to enhance and upgrade it is minimal.

One of the areas we got hung up on when discussing shareware was on-going support. Like David mentioned above, it's easy to walk away when the point of diminishing returns has been reached. Since there are no tangible returns to diminish, think of it as "you got what you paid for" and move on. When I develop applications for a client, I maintain and upgrade them as long as that client asks. To date, I haven't turned down a request for an update to a function.

I'll start the bidding, if you name a price.

When Ken buys a book he gets another couple hours of free consulting help. When he mentions the book on the newsgroup he gets a free Coyote T-Shirt and a tape of yours truly telling Coyote stories. :-)

Cheers,

David

P.S. Just kidding about this. I don't want to be responsible for turning the newsgroup into a testimonial about the benefits of the book. But I do greatly appreciate Ken's, and everyone else's, support.

I try to repay some of the answers that I have gotten here by answering questions myself, when I can.

When David spends a lot of time helping me, I buy one of his books. :-)
That way we both benefit.

Ken

I like the idea of either a single application, or a suite of applications around a concept that could be purchased for a reasonable amount of money, and that support/upgrades were handled in a similar way to the unix gnu world.

I use IDL a lot. Every day basically. I write lots of "amateur" routines that do not get well documented, are not well maintained etc. However, as a scientist, if someone wanted them for free - they could have them - as is. I think that is the policy of a lot of scientific centers (based on what is publicly available for IDL - though perhaps a bit more professionally written :-}). But, there is a big difference to go to truly well written, well thought out, documented applications. A suite of Plotting/printing routines being a good example. For example, I have had a student spending about 6 months of her time, developing a gui driven plotting program for our particular brand of ionospheric data. We have it in house, it is good - for our amatuer level - and the other people in my group are clamoring for upgrades. I have to wonder if something similar was available for ~ \$100 per license or so, if it would not be attractive....

As far as the rest goes - I would not know who David is, or the others who give their time and advice (as well as compensated things like books etc), if they did not appear on this site. So, in my opinion I consider it a service to the community - no one is hawking wares, and this is a small enough community, that in general, Barnes and Nobles does not keep 10 IDL programming books on it shelves.....so, this is the source of info.

Cheers,
