HI EVerybody!

We are using IDL 5.0 for medical image analysis (3D, Virtual Endoscopy,
Digital Mammography).

We want to use Wavelets for background suppression in digital mammograms and

this features with others to an ANN to differentiate cancerous and non
cancerous ones.

We have loaded the wavelet workbench from:

<http://www.amara.com/wwbdev/wwbdev.html>

Qestion: has somebody experience with that package and can give us some
advice how to use it efficiently??

BEST REGARDS

ERICH SORANTIN
