Hi Folks,

This is a commercial message (although humbly offered in terms of a public service announcement). Those of you offended by that can either delete it now or send your flames to me at the address below. :-)

Many of you have contacted me to express an interest in learning some of the object-oriented programming techniques I have been talking about recently on this newsgroup. I wanted to let you know that I still have room in my Object-Oriented Programming course that I will be teaching in LA June 21-24. (I know, LA in June is not my favorite idea either, but on the bright side, things will be happening at the beach!)

This is shaping up to be a smallish class, which means we will move quickly and cover a lot of ground. You will have the benefit of a lot of personal attention. :-)

I'm planning to write a number of powerful programs using object-oriented techniques and IDL direct graphics commands. We will probably create something very similar to the plot and window objects I've been raving about on this newsgroup.

In addition, we will be spending about half our time learning the new IDL object graphics system. This system is so completely different from what you may be used to in IDL, that I think the introduction is essential if you want to get a jump start on using this functionality.

If you are interested, please contact the RSI training department as soon as possible. They can be reached at training@rsinc.com. They can give you the details about the course.

Best Regards,

David
