I've been using IDL 5.1 pretty extensively on a Windows NT
machine and have not see this problem at all.

Cheers,

David

hmmm, obviously 300 MHz are just too fast for FONTS, they'll have to be
changed to FNS to run fast enough ;-)

[Sorry, I've just been in a silly mood]

We have the same problem with a new 300 MHz Windows NT machine. I don't think
the problem has anything to do with IDL. I can leave the machine doing nothing
overnight (just login screen and screensaver) and in the morning the fonts are
screwed up. I am leaning toward the video hardware/driver as the problem.
