While the actual contents and cross referencing of the online help in IDL is exceptionally good, there is one glaring deficit in the current help browser - the ability to create an editable hierarchy of bookmarks. I can no longer imagine navigating the web without such a feature in my browser; it would be nice to see IDL adopt this paradigm.

A smaller annoyance is the segmentation of help files into different "books". Why must I switch books in order to read about widgets instead of object graphics (can I sense legacy code at work here)?

Comments?

Darran.
