I would like to know if somebody has already developped
"macro widgets" constructed with the base widget furnished with Wave.

By "macro widgets" I mean for example:

A 2D widget which could be a window with a menu bar allowing to set the various options of
Plot : (Xrange , etc ..)

A xpalette widget allowing to modify the color table using the X interface

And so on

I believe that with IDL such macro widgets already exist, but Wave and Idl widgets are not
compatible .

Thank you very much
