Hi,

I've got two questions concerning the adaption of IDL-routines written on SunOs
for MsWindows:

- does anyone have a list of general hints to this problem, like

; avoid system-calls

; short (8 characters) routine-names

; ... ?

- how can use non-printable characters under MsWindows, p.e.:

; print,'\\007' ; (bell)

; print,'\\x08' ; (move cursor left) ?

MsWindows just prints ths string on the screen.

thanks,

Karl
