
Subject: [IDL/ENVI] Extracting points from *.roi files

Is there an easy way in envi or other method in which to extract the pixel/array points for a given array from a region of interest (roi) file? The units are in pixels (and the image in question is ungeoreferenced) so there are no map projection issues. Common sense tells me it should be straight forward.

Ideas?

The ENVI Statistics function takes a ROI as valid input area , so this is
one way to
get average pixel information.
If you want a rectangular subwindow just use the 'select bands and area' widget
available for nearly all ENVI processing routines.

Hope this helps, Servus, Helge
